

I do not understand how this proposal can be of benefit to the public. It cannot be anything but a source of interference for more services than can be imagined.

Concerning myself, how will it impact on my various hobbies including short-wave listening, amateur radio, and FRS, How will it impact persons who still have older cordless phones, baby monitors etc. It undoubtedly will impact poor quality cable TV companies also. The next question is how can the FCC control the power companies when they increase the power to the proposed levels. It will be almost impossible to control!

Please reconsider this proposed and not allow it to proceed.

Thank you.
